

Java SE 7

Module 1 Java Basics

Tools

- JDK (Java Development Kit)
- IntelliJ IDEA (The best tool for Java coding)

Folder Structure

there is no **SPACE**s here

IntelliJ IDEA Usage

- Create new project
- Syntax highlighting
- Suggestions
- How to run your code

```
public class FileStructure
{

    public static void main(String[] args)
    {
        // comments looks like this

        // your code here between { }
    }

}
```

```
public class FileStructure
{

    public static void main(String[] args)
    {
        // comments looks like this

        // your code here between { }
    }
}
```

```
public class FileStructure  
{
```

```
public static void main(String[] args)  
{  
    // comments looks like this  
  
    // your code here between { }  
}
```

```
}
```

```
public class FileStructure  
{
```

```
public static void main(String[] args)  
{  
    // comments looks like this  
  
    // your code here between { }  
}
```

```
}
```

Part 1

Numbers & Strings

```
public static void main(String[] args)
{
    System.out.println( 232 );
    System.out.println( 34 );
    System.out.println( 10 + 6 );
}
```

Quick Task

Calculate number of seconds in 9 weeks.

```
System.out.println( 10 / 3 );
```

```
System.out.println( 10 % 4 );
```

```
public static void main(String[] args)
{
    System.out.println(Integer.MIN_VALUE);
    System.out.println(Integer.MAX_VALUE);
}
```

```
public static void main(String[] args)
{
    System.out.println(Integer.MIN_VALUE - 1);
}
```

```
public static void main(String[] args)
{
    System.out.println("Max + 1: " + (Integer.MAX_VALUE + 1));
}
```

Variable

[int]

[int]

type nameCamelCase = <expression> ;

```
int    countOfSeconds = 90;
```

```
int countOfHoursInOneWeek = 24 * 7;
```

```
int randomExpressionExample =  
    9 * 34 - 14 * (43 + 90) / 80 % 3;
```

```
type nameCamelCase = <expression>;
```

Type	Name	Value
int	countOfSeconds	60
int	countOfHoursInOneWeek	168
int	randomExpressionExample	304

```
int secondsInMinute = 60;
```

```
int tenMinutes = 10 * secondsInMinute;
```

```
type nameCamelCase = <expression>;
```

Quick Task

Calculate number of seconds in 9 weeks.

Please use variables now!

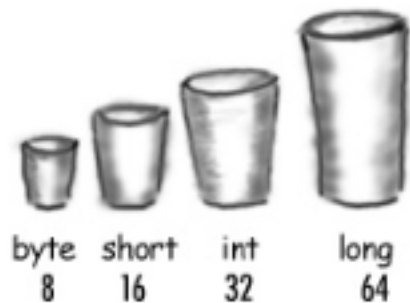

```
double randomPrice = 459.98;
```

```
double youCanAlsoDoTheMathHere = 34.9 + 98 * 6;
```

```
float iNeedFloat = 4.05f;
```

```
type nameCamelCase = <expression>;
```

Primitive types

boolean and char

boolean (JVM-specific) **true** or **false**

char 16 bits 0 to 65535

numeric (all are signed)

integer

byte 8 bits -128 to 127

short 16 bits -32768 to 32767

int 32 bits -2147483648 to 2147483647

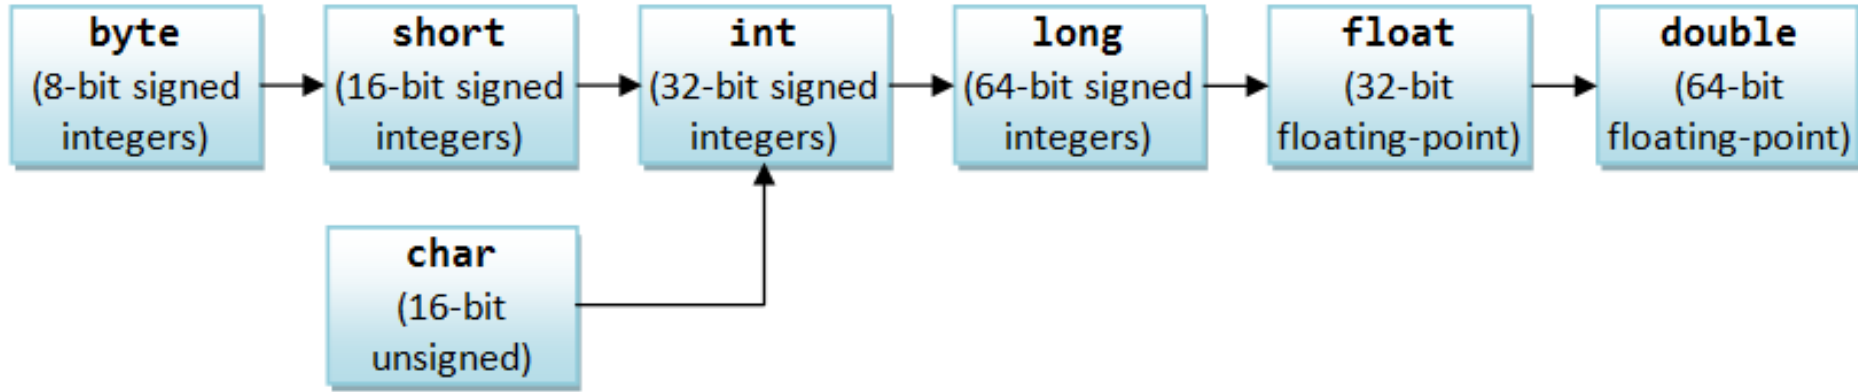

long 64 bits -huge to huge

floating point

float 32 bits varies

double 64 bits varies

Primitive data types casting

Orders of Implicit Type-Casting for Primitives

Primitive data types casting

part1.E3_Casting

```
int i = 19;  
long l = 455L;
```

```
l = i;  
i = (int) l;
```

String

part1.E5_String

```
String oleg = new String("Oleg");
```

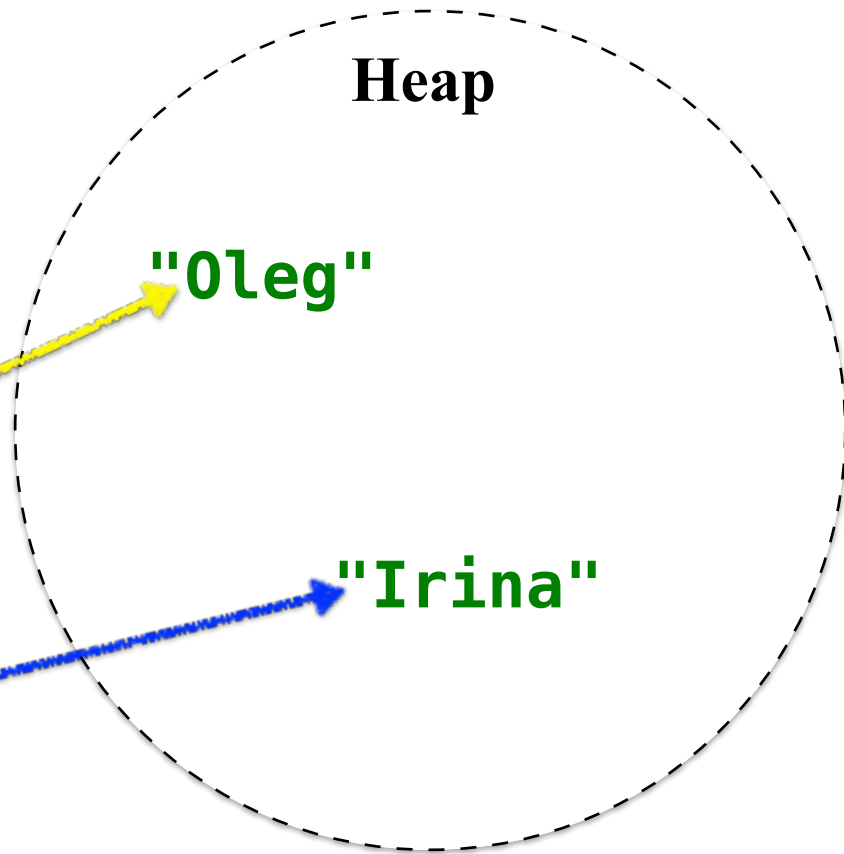

```
String irina = "Irina";
```

```
type nameCamelCase = <expression>;
```

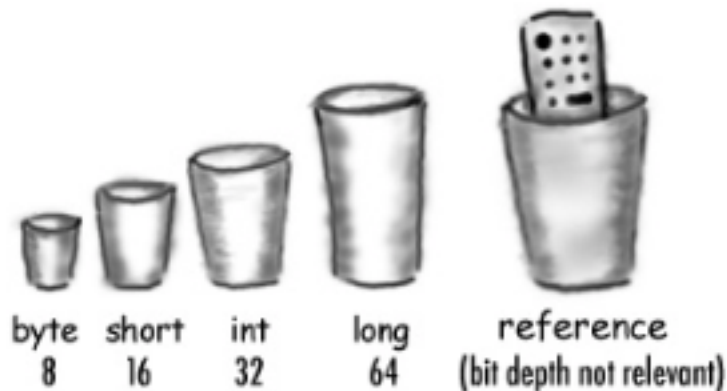

String in memory

part1.E5_String

Type	Name	Value
String	oleg	Ref
String	irina	Ref

Reference Type

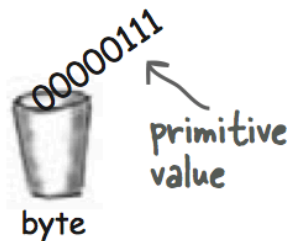

An object reference is just another variable value.

**Something that goes in a cup.
Only this time, the value is a remote control.**

Primitive Variable

byte x = 7;

The bits representing 7 go into the variable. (00000111).

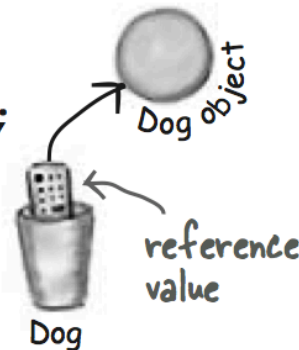

Reference Variable

Dog myDog = new Dog();

The bits representing a way to get to the Dog object go into the variable.

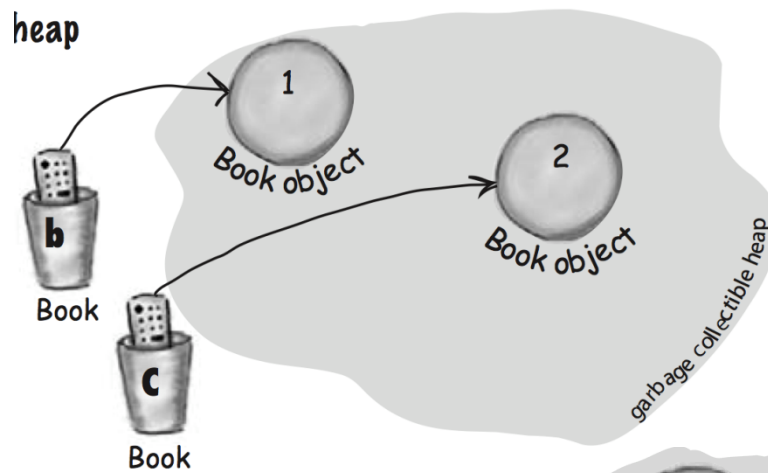

The Dog object itself does not go into the variable!

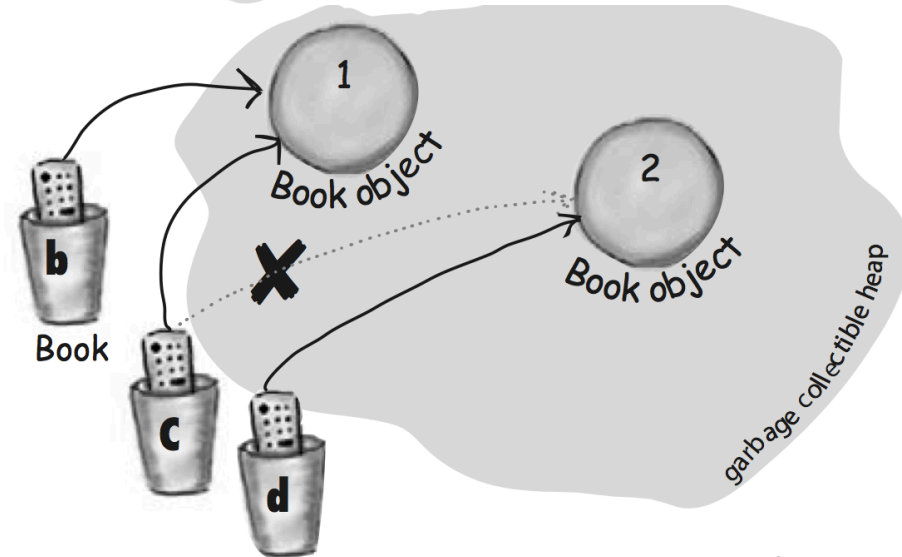

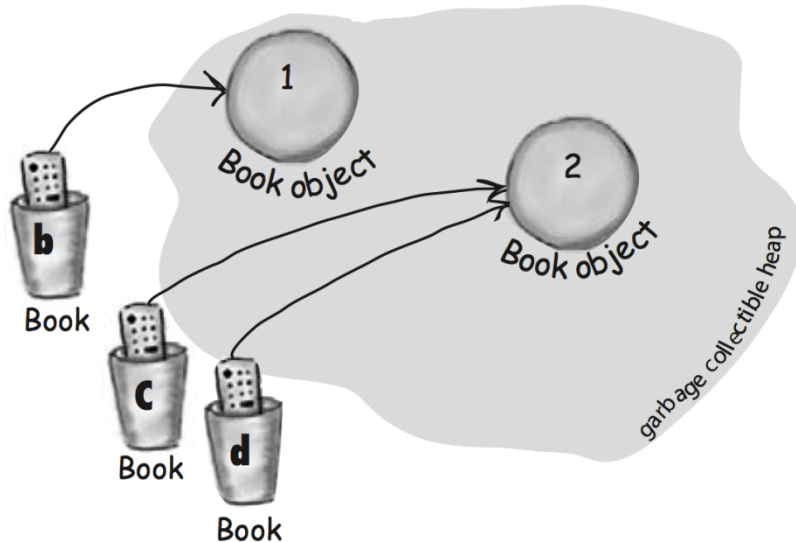

Heap life

```
Book b = new Book();  
Book c = new Book();
```

```
Book d = c;
```

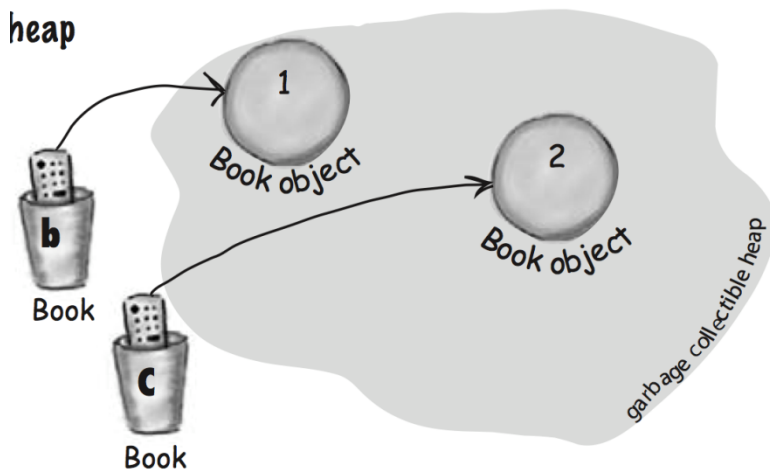

$c = b;$

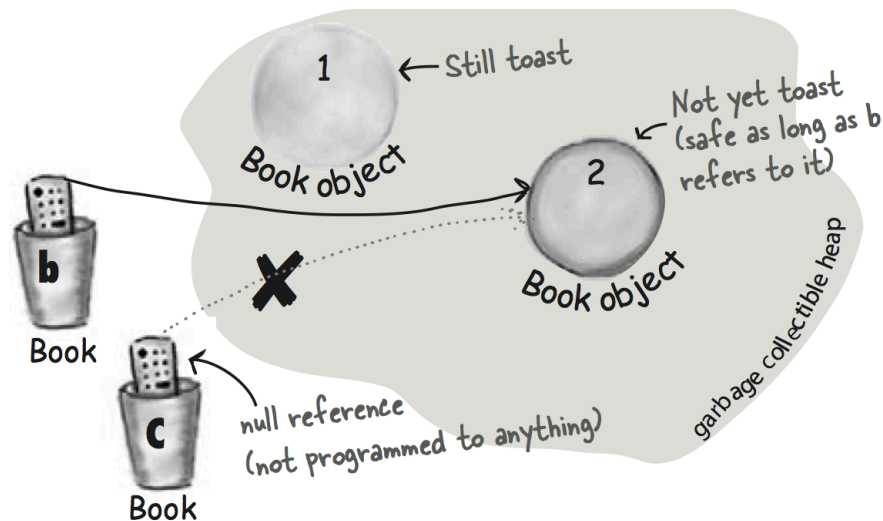

Heap life

```
Book b = new Book();  
Book c = new Book();
```

```
b = c;  
c = null;
```

String concatenation

```
String oleg = new String("Oleg");
```

```
System.out.println("0: " + oleg);
```

```
oleg += "!";
```

```
System.out.println("1: " + oleg);
```

Output:

0: Oleg

1: Oleg!

```
String name = "Alexandra";
```

```
int length = name.length();
```

```
System.out.println(name + " contains "  
    + length + " letters.");
```

Runtime exception

part1.E7_NPE

```
String str = "abcdefg...";
```

```
System.out.println("0: " + str);
```

```
str = null;
```

```
System.out.println("1: " + str.length());
```

Type char

```
char a = 'a';  
System.out.println(a);
```

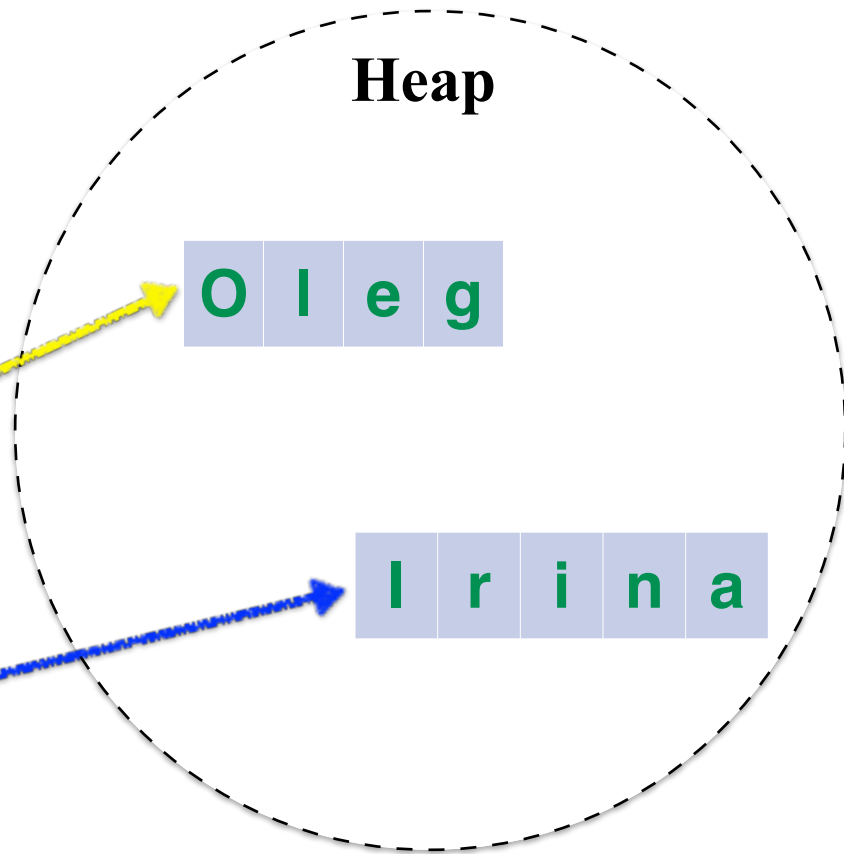

```
char A = 65;  
System.out.println(A);
```

Char range: 0 - 65535

String in memory

part1.E5_String

Type	Name	Value
String	oleg	Ref
String	irina	Ref

Chars in String

```
String galaxy = "Milky Way";
```

int index

```
char ch = galaxy.charAt(0);
```

Chars in String

part1.E9_CharsInString

```
String galaxy = "Milky Way";
```

int ch

```
galaxy.indexOf('y');
```

```
galaxy.indexOf('y', 5);
```

int ch, int fromIndex

Use `==` to check that variables referencing the same object.

Use `.equals` to check that objects equals according to our comparison rules.

String methods, substring

```
String str = "Programming is cool.";
```

int beginIndex

```
String substring = str.substring(3);
```

```
substring = str.substring(11, 14);
```

int beginIndex, **int** endIndex

String methods, replace

part1.E11_StringMethods

```
String str = "Programming is cool.;"
```

```
String replaced = str.replaceAll("is", "-");
```

String regex, String replacement

You have random **double** number. Write a program that prints to the output whole and fractional parts separately.

For example:

343.36 whole: 343, fract: 36

3.069 whole: 3, fract: 069

.2 whole: 0, fract: 2

Quick Task

part1.T1_BattleField

	A	B	C	D	E	F	G	H	I
1	B	B	B	B	B	B	B	B	B
2									
3	B	B		B	B	B		B	B
4	B	B		B	B	B		B	B
5	B	B		B	B	B		B	B
6	B	B	B		B	B			B
7	B	B	B		B	B			B
8	B	B	B		B	B			B
9	B	B	B	T	E	B	B		B

B - Brick

T - Tank

E - Eagle (headquarters)

Part 2

Methods

What method is?

Method signature

any existing java type or **void** *

any existing java type

```
public static return_type nameCamelCase(p1_type p1, p2_type p2)
{
    [return 0];
}
```

required if method **return_type** is not **void**

***void** - means nothing to return.

Implement method **moveForward()**. Tank should move one quadrant right after each call.

Implement method **getTankQuadrant**(**int** x, **int** y).

Method should return name of the quadrant according to given coordinates.

Method params.

How Java calls methods and send parameters to it.

Method overloading.

You can declare methods with identical name if param types are different.

```
public static int sum(int a, int b)
{
    return a + b;
}
```

```
public static long sum(long a, long b)
{
    return a + b;
}
```

Method overloading.

You can declare methods with identical name if param types are different.

```
public static int sum(int a, int b)
{
    return a + b;
}
```

```
public static int sum(int a, int b, int c)
{
    return a + b + c;
}
```

Visibility

Variables are visible and can be used within a block where it's declared.

if statement

part2.E1_if_Statement

any **boolean expression**

if (a % 2 == 0)

{

a *= 2;

this code will be executed **only if boolean expression** returns **true**

}

if-else statement

part2.E2_if_else_Statement

```
if (a % 2 == 0)
```

```
{
```

```
    boolean expression == true
```

```
    a *= 2;
```

```
}
```

```
else
```

```
{
```

```
    boolean expression == false
```

```
    a /= 3;
```

```
}
```

else-if statement

part2.E3_else_if_Statement

```
if (a > 8)
{
    System.out.println("--> if a > 8");
    a += 3;
}
else if (a > 3)
{
    System.out.println("--> if a > 3");
    a += 2;
}
else
{
    System.out.println("--> else");
    a += 1;
}
```

while Loop

```
int counter = 0;
```

any **boolean expression**

```
while (counter < 10)
```

```
{
```

```
    System.out.println(counter++);
```

this code will be executed **until boolean expression** returns **true**

```
}
```

```
while (counter < totalCycles)
{
    if (counter == 7)
    {
        break;
    }
    System.out.println(counter++);
}
```

```
while (counter < totalCycles)
```

```
{
```

```
    if (counter % 3 == 0)
```

```
    {
```

```
        counter++;
```

```
        continue;
```

```
    }
```

```
    System.out.println(counter++);
```

```
}
```

will **start** next iteration

Implement logic that forces a tank moving forward and then backward forever.

Tank should slowly move from quadrant **A1** to **A9**, then from **A9** to **A1** and so on...

Implement method **void move(int direction).**

One method call should smoothly move the tank one quarant according to given **direction** parameter value.

direction

- 1 - up
- 2 - right
- 3 - down
- 4 - left

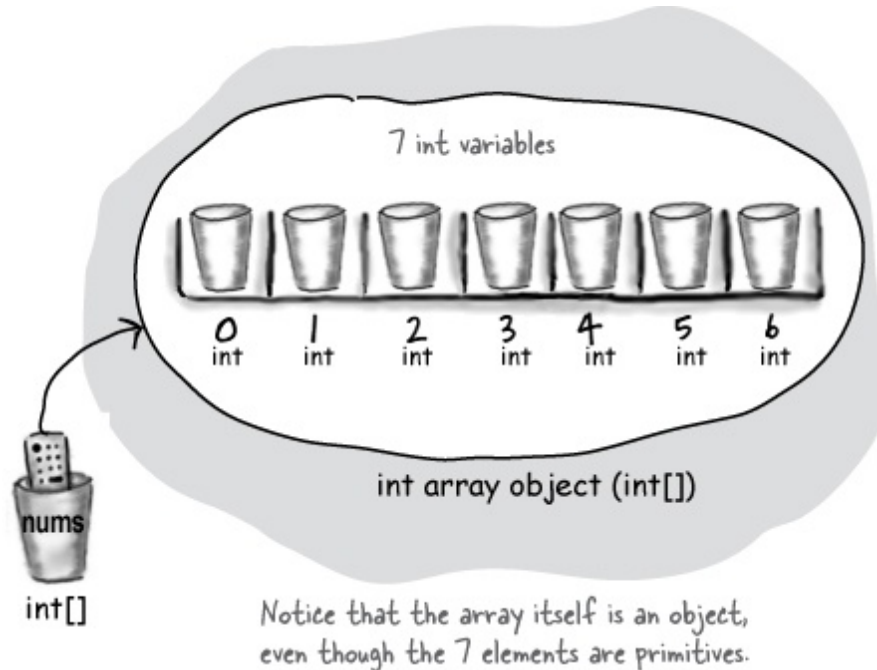

Part 3

Arrays

What is array?

Data structure that keeps limited number of objects with defined type.

How to create array

any valid Java type

```
type[] anyName = new type[number_of_objects];
```

How to create array, examples

part3.E0_CreateArray

```
int[] numbers = new int[10];
```

```
double[] prices = new double[10];
```

```
int[] ints = new int[] {1, 2, 3};
```

```
int[] data = {1, 2, 3, 4, 5, 6, 7};
```

```
int[] numbers = {0, 1, 2, 3, 4, 5, 6, 7, 8, 9};
```

```
int num;
```

```
num = numbers[3];
```

```
num = numbers[7];
```

```
numbers[0] = 100;
```

```
numbers[6] = 600;
```

Array, data access

- 1 Declare an int array variable. An array variable is a remote control to an array object.

```
int[] nums;
```

- 2 Create a new int array with a length of 7, and assign it to the previously-declared `int[]` variable `nums`

```
nums = new int[7];
```

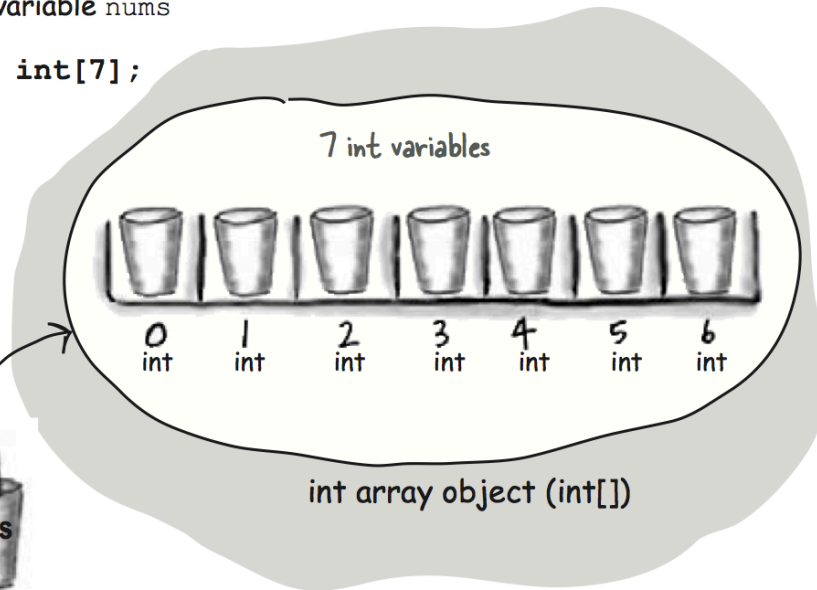

- 3 Give each element in the array an int value. Remember, elements in an int array are just int variables.

7 int variables

```
nums[0] = 6;  
nums[1] = 19;  
nums[2] = 44;  
nums[3] = 42;  
nums[4] = 10;  
nums[5] = 20;  
nums[6] = 1;
```

`int[]`

Notice that the array itself is an object, even though the 7 elements are primitives.

What this code prints?

```
public static void main(String[] args)
{
    int[] numbers = {0, 1, 2, 3, 4, 5, 6, 7, 8, 9};

    setValue(numbers, 3, 300);
    System.out.println(Arrays.toString(numbers));
}

public static void setValue(int[] data, int idx, int value)
{
    data[idx] = value;
}
```

Implement method **void swap(int[] data, int idx1, int idx2)**.

Method should exchange values with **idx1** and **idx2** in **data** array.

for loop

```
int[] numbers = {0, 1, 2, 3, 4, 5, 6, 7, 8, 9};
```

```
for (int i = 0; i < numbers.length; i++)  
{  
    int n = numbers[i];  
    System.out.println(n);  
}
```

int i = 0; initialization

i < numbers.length; condition

i++ increment

Quick Task, use for Loop

part1.T1_BattleField

	A	B	C	D	E	F	G	H	I
1	B	B	B	B	B	B	B	B	B
2									
3	B	B		B	B	B		B	B
4	B	B		B	B	B		B	B
5	B	B		B	B	B		B	B
6	B	B	B		B	B			B
7	B	B	B		B	B			B
8	B	B	B		B	B			B
9	B	B	B	T	E	B	B		B

B - Brick

T - Tank

E - Eagle (headquarters)

for-each loop

part3.E4_for_each_Loop

```
int[] numbers = {0, 1, 2, 3, 4, 5, 6, 7, 8, 9};
```

```
for (int n : numbers)  
{  
    System.out.println(n);  
}
```

numbers data structure to iterate

n current element

Quick Task

part3.T1_Sort

Implement method **void sortAsc(int[] data)**.

Method should sort **data** array ascending order.

Array of Strings (objects)

part3.E5_ArrayOfStrings

```
String[] names = new String[10];  
System.out.println(Arrays.toString(names));
```

```
names[3] = "Anna";  
names[9] = "Max";
```

Array of Strings (objects)

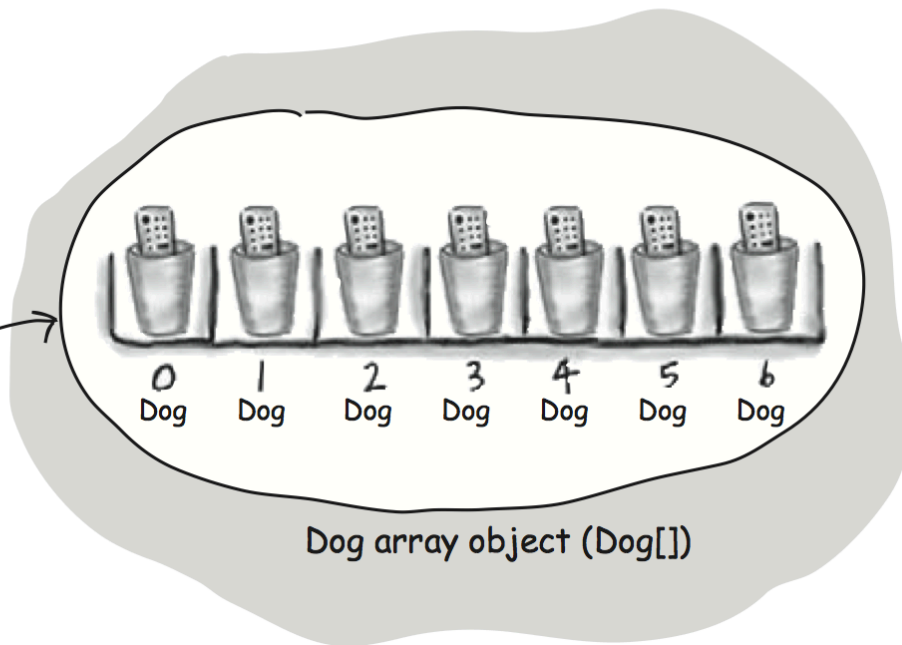

Make an array of Dogs

- 1 Declare a Dog array variable
`Dog[] pets;`
- 2 Create a new Dog array with a length of 7, and assign it to the previously-declared `Dog[]` variable `pets`

```
pets = new Dog[7];
```

What's missing?

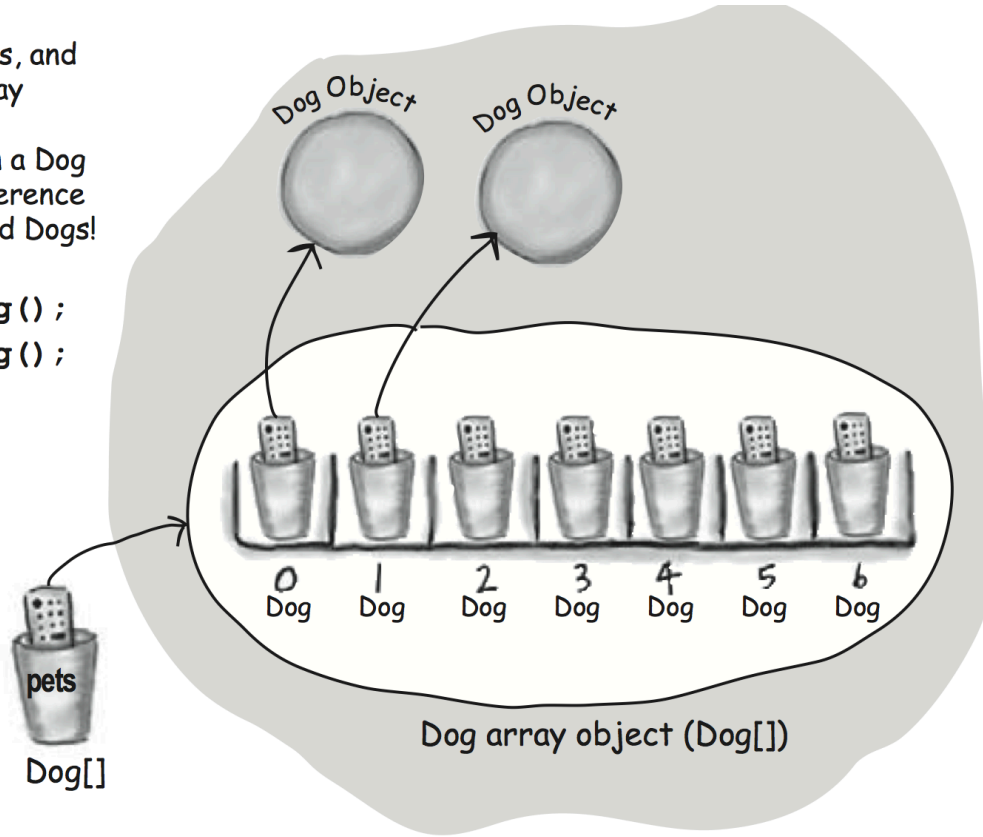

Dogs! We have an array of Dog references, but no actual Dog objects!

Array of Strings (objects)

- 3 Create new Dog objects, and assign them to the array elements. Remember, elements in a Dog array are just Dog reference variables. We still need Dogs!

```
pets[0] = new Dog();  
pets[1] = new Dog();
```

Multidimensional array

any valid Java type

```
type[][] name = new type[number_of_objects][];
```

Multidimensional array, usage example

part3.E6_MultidArray

```
int[][] data = new int[10][];
```

```
data[0] = new int[] {1, 2, 3};
```

```
data[1] = new int[] {1, 2};
```

```
int[] numbers = data[0];
```

```
int number = data[0][1];
```

```
data[1][0] = 1000;
```

Quick Task, use String [][]

part1.T2_BattleField

	A	B	C	D	E	F	G	H	I
1	B	B	B	B	B	B	B	B	B
2									
3	B	B		B	B	B		B	B
4	B	B		B	B	B		B	B
5	B	B		B	B	B		B	B
6	B	B	B		B	B			B
7	B	B	B		B	B			B
8	B	B	B		B	B			B
9	B	B	B	T	E	B	B		B

B - Brick

T - Tank

E - Eagle (headquarters)

Implement method **void fire()**.

When called tank should produce new bullet.

This bullet should smoothly move to the opposite side.

Bullet should be destroyed when rich the opposite side.

Ignore all the objects on battle field for now.

Implement method **boolean checkAndProcessInterception()**.

Should return true if bullet located in non-empty quadrant.

Also update your **void fire()** method.

When the bullet shoot something method should clean appropriate quadrant and destroy the bullet.

Final Task

Old friend Nikolay said that he just opened a shop where he is selling birds and you immediately gave him an advice to use a computer program.

You explained that you are a programmer and you will write this program for Nikolay right now.

Final Task, continue

Nikolay said that he has some notes and showed you the next:

- Bird name (crow, eagle, duck)
- Current price in USD (crow - 1, eagle - 5, duck - 0.5)
- Count of birds in the store (crow - 20, eagle - 23, duck - 4)
- Birds sold (crow - 3, eagle - 1, duck - 23)

Final Task, continue

Implement your programm in file **Birds**.

Implement next methods:

- how many birds sold
- how many birds of given type in stock
- what types of birds less then 3 in stock

Make this program useful for your friend !!!

Tasks (optional)

- Exercise 1

Home Work (Optional)

part2.T4_Tanks

Implement method **void randomMove()**.

One method call should smoothly move the tank one quarant to random direction.

Do not use **java.util.Random**

Implement method

void moveToQuadrant(String quadrant).

Where **quadrant** - quadrant name in format **a4, h6, i8**.

Tank should detect given quadrant and smoothly move to it.

Task (Optional)

part2.T3_CleanBattleField

Implement method **void clean()**.

When method called tank should destroy all the objects on battle field in less then 30 seconds.
